Subject:	Add support to browse newsgroups		
Description:	For low volume newsgroups it's good to have the ability to browse them. There are two possible directions which can be taken here: 1. Retrieving and parsing all headers in newsgroups is done by the user 2. Retrieving and parsing all headers in newsgroups is done by the NZBCreator service Option 1 has the disadvantage that it can take a lot of time to retrieve all headers. Next to this, NNTPGrab isn't really well suited for browsing newsgroups due to it's client/server nature (it can require a lot of traffic from server to the client) Option 2 has the advantage that all the newsgroup information is already maintained in the NZBCreator. All that has to be done is adding scripts to present the newsgroup information in a readable format. At the moment it isn't certain which path is going to be used
